

Create a Shortcut Application for pairing your AirPods

With this shortcut application, you can pair your AirPods in just one click!

Written By: Aaron Cooke

INTRODUCTION

This handy shortcut will allow you to pair your AirPods in just one click, rather than going to Bluetooth>YourAirPodsNameHere>Connect. In the long run it could save you up to 18 min each year!

Step 1 — AppleScript or Script Editor

- Open AppleScript or Script Editor, whichever comes up for you.
- Go to Finder > Applications > Utilities > Script Editor/AppleScript

Step 2 — AppleScript or Script Editor

- At the popup for Script Editor click New Document at the bottom left corner. Then Copy and Paste the code into Script Editor/AppleScript that I have provided down below in the link.
- (i) <u>AirPods Shortcut Script</u>

Step 3 — Configuring the Script

- *"Are we done yet?"* No, thanks for asking.
- Next, we have to configure the Script. First, have a look at my image and select the group of text I circled. Replace that text with the name of your AirPods. Keep the quotation marks around the name or the Script will not function.
- For example, my AirPods are named "Jet the Hawk".
- You may want to rename your AirPods to a different name without apostrophes because I could not get this to work when my AirPods were named "Aaron's AirPods".

Step 4 — Creating the Application

 Now press Command + S at the same time to save the file. Name it Connect to AirPods and save it in Application file format. Save it to your desktop.

Step 5 — Running the Application for the first time

| | | | General | I FileVault Firewall Privacy |
|------------------------------|--|------|-----------------------------------|--|
| Genera | I FileVault Firewall Privacy | | Location Services | Allow the apps below to control your computer. |

| Cck the lock to make changes | . Advanced ? | | Click the lock to prevent further | r changes. Advanced ? 0 |

- (i) The first time you run this Application you will need to allot it permissions to control system functions otherwise it will throw errors.
- Go to System Preferences > Security & Privacy > Accessibility > Privacy
- Click the lock and enter your admin username and password.
- Check the box to the left of Connect to AirPods

Step 6 — OPTIONAL: Creating a Custom App Icon

- This step is completely optional, you can be done here for it to work properly. Click the App twice in order for it to connect to your AirPods.
- (i) Creating a custom App icon is totally optional, but here's how you do it.
 - Download Image2Icon from the Mac App Store. It is completely free, no worries.
 - You can download Image2lcon <u>here</u>.

Step 7 — Creating a custom App icon

- Find a good image to use as your App icon, preferably a .png icon.
- (i) I used this image here as my icon, you can use it if you want.
- Now, open Image2Icon and drag and drop the image you want as the icon into the Image2Icon window.
- Drag the Connect to AirPods Application into the Image2lcon window
- You should see your Application with the icon you selected with now. You may need to right click it and open it thru there because it probably will say it is from an unidentified developer and block it. You will need to be an admin to bypass this too.

Enjoy your new shortcut!
