

How to Unclog a Toilet Without a Plunger

This guide will show you how to unclog a toilet without a plunger.

Written By: zahra azad

INTRODUCTION

A toilet may be clogged with different things or for different reasons, and most people may try to clear it with a toilet plunger. However, some people may not have access to a toilet plunger. The method in this guide is cheap, fast, and easy and only requires simple tools and materials available at home.

Keep in mind, it's not a good idea to keep flushing a blocked toilet. This will result in a toilet bowl overflow.

TOOLS:

- [Bucket](#) (3)
 - [Dish Soap](#) (1)
 - [Nitrile Gloves 100 Box](#) (1)
-

Step 1 — How to Unclog a Toilet Without a Plunger

- If the toilet bowl is full of water, empty the water manually with a small or medium container so that there is enough space to add a gallon of liquid.

 It's recommended to wear gloves (plastic or silicon gloves) for this part.

Step 2

- Prepare a gallon of hot (not boiling) water.

 The water temperature shouldn't be too hot because it may cause the toilet bowl to crack.

Step 3

- Divide the gallon of water into three separate containers.
- Pour one portion of hot water into the toilet bowl and let it rest for about 20 minutes. Repeat for the other two portions of hot water.

Step 4

- Fill the blocked part of the bowl with no more than half a cup of dish soap.
 - Let the soap sit in the toilet bowl for a few minutes.
- i** The soap's grease-cutting properties could ease in removing any solids that may have created the clog.

Step 5

- Check the toilet bowl to see if the water level has decreased or remained the same.
- If the water level decreased, flush the toilet. If it starts to overflow again, turn off the water valve from behind the toilet, and repeat Steps 1–3.
