INTRODUCTION

This guide will be utilized mainly if your CPU has gone bad and your laptop is essentially nonfunctional.

TOOLS:

- Phillips #1 Screwdriver (1)
- Flathead Screwdriver (1)

PARTS:

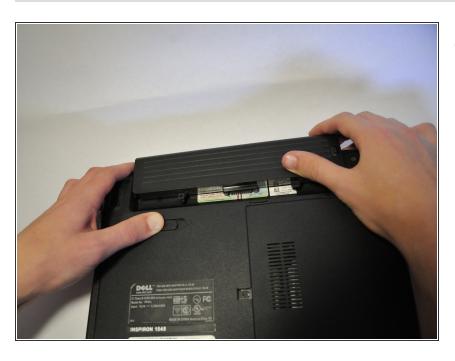

• Dell Inspiron 1545 (PP41L) CPU (1)

Step 1 — Battery

- Before attempting to remove the battery ensure that the laptop is disconnected from all power sources and turned off.
- Turn the laptop over to its back.

Step 2

 Slide the release latch while simultaneously pulling backwards on the battery.

 Slide the battery out of the battery bay.

Step 4 — Base Cover

- Unscrew the four screws (3mm
 Phillips #1) that hold the base cover in place.
- i The screws are connected to the base cover by a washer anddo not remove from the base cover.

Carefully lift the base cover vertically away from the laptop.

Step 6 — CPU Heat Sink

- Loosen the 5 screws (4mm, Phillips #1) that secure the CPU Heat Sink to the motherboard.
- i These screws are held in place by a washer so you should not be able to completely remove the screws.

 Pull up on the Heat Sink unit to remove it.

Step 8 — Computer Processing Unit

 Using a flathead screwdriver, rotate the locking mechanism counterclockwise to the unlocked position.

- The CPU is very fragile and has thin pins.
 - Remove the CPU by pulling straight upward and away from the laptop.

To reassemble your device, follow these instructions in reverse order.
